

CCS DURATRAC HB EPOXY

March 2022

DESCRIPTION

CCS Duratrac HB Epoxy is a high solids, two-component crystal clear, high gloss and high-performance trade strength floor coating system suitable for residential, industrial and commercial use. CCS Duratrac HB Epoxy can be tinted with CCS compatible tints.

RECOMMENDED USES

CCS Duratrac HB Epoxy is designed to be a stand-alone roller coat epoxy system suitable for an extensive range of uses in residential, commercial and industrial applications where a durable, robust and long-lasting coating is required.

PACKAGING

CCS Duratrac HB Epoxy is available in a 15 litre, two component kit.
 Part A: 10 litre
 Part B: 5 litre

COVERAGE RATES

Typical coverage is 4-5 m² per litre per coat, two coats. Coverage may vary depending on the surface texture and porosity of the concrete.

TECHNICAL PROPERTIES

MIXED SOLIDS	>85%
Mix Ratio A:B	2:1 volume
Specific Gravity	1.09 mixed approx
Specular Gloss 60°	90+ (5m ² /litre)
Mixed Viscosity 25°C	600 cPs approx
Pot Life @20°C, 60%RH	45-55 mins approx
Drying Time @20°C, 60%RH	6 hours – touch 18 hours – traffic 7 days – full cure
Recoat Window	8-24 hours
Durability	Interior use only
Water Resistance	Excellent
Chemical Resistance	Good resistance to ACIDS ALKALIS AND MOST COMMON SOLVENTS
Stain Resistance	Very Good
Abrasian Resistance	Very Good

APPLICATION

Preparation

Ensure the floor to be coated is free of all efflorescence, laitance, dirt, grease, oil, paint, curing agents, dust, wax and all other contaminants.

If the floor is smooth or if curing agents have been applied, mechanical grinding or abrasive blast cleaning is recommended to ensure proper adhesion. Conduct a water test before applying CCS Duratrac HB Epoxy by sprinkling water drops on various parts of the floor and observe how quickly they absorb into the surface.

New concrete floors should be at least 28 days old before application of CCS Duratrac HB Epoxy.

Concrete must be free of moisture before application of CCS Duratrac HB Epoxy (this can be tested by taping a piece of plastic over a small area and inspecting the inner surface for free moisture - refer to ASTM-D-4263 Plastic Sheet Test). Alternatively use a moisture meter.

MIXING

Using a mechanical stirrer premix Part A until homogeneous (1-2 minutes) at low speed.

If colour is required, add tint and premix until homogeneous. Slowly add tint pack to Part A whilst stirring, ensuring that the sides of both containers are scraped down so that all the colour is added and there is no residue of clear epoxy on the walls of the pail.

Allow mixed product to stand for 3-5 minutes to release air.

Add Part B to the Part A/tint mix and mechanically stir for 1-2 minutes.

Allow to stand 3-5 minutes to release air before use.

Only mix as much as is likely to be used within the pot life of the product – approximately 35-45 minutes.

Do not seal or place a lid on mixed product as the heat of reaction causes pressure build up.

Application Method

Apply CCS Duratrac HB Epoxy with a lambswool applicator or mohair roller. If required use a spiked roller to remove any air bubbles.

First Coat

Apply CCS Duratrac HB Epoxy at a rate of 4-5m² per litre. If a textured or anti-slip surface is required apply CCS Duratrac HB Epoxy at 4m² per litre and then apply an appropriate anti slip medium such as CCS Slip Reduction Granules.

Allow 8 hours drying then remove excess anti-slip with broom or vacuum. Ensure that all dust and any other contamination is removed thoroughly.

Second Coat

Apply second coat inside recoat window (8-24 hours). After 24 hours the floor may no longer accept a second coat without the possibility of fish-eyeing and subsequent delamination. If applying a second coat outside of the recommended recoat window time sanding of the surface will be required to ensure proper inter-coat adhesion.

Mix and Apply CCS Duratrac HB Epoxy uniformly at a rate of 4-5m² per using clean bucket and mixer.

Allow 24 hours cure time before subjection to pedestrian traffic, 72 hours for vehicular traffic and 5-7 days before subjecting to chemicals or severe abrasion

CCS DURATRAC HB EPOXY

March 2022

CLEAN UP

Use CCS Solvent to wash all tools immediately following application.

SPECIAL DECORATIVE FINISHES

CCS Duratrac HB Epoxy may be used as part of many other internal decorative finishing systems, including flake flooring. CCS technical staff can provide more detailed instruction upon request.

OPTIONAL TOP COATS

- CCS Armourthane
- CCS Armourguard
- CCS Decrathane
- CCS Rapid Floor Polyaspartic

These coatings are all high-performance scratch and abrasion resistant coatings with the additional benefits:

They contain UV absorbers which slow down the natural yellowing of epoxy floors which occurs with age and exposure to ultraviolet light, even in interior areas, thus extending service life. Various gloss levels are available from high gloss through to satin/matt. They are also well suited for lock-in and finish coats in seamless/flake floor systems.

It should be noted however:

The use of these coatings still does not make the system suitable for exterior exposure as epoxy chalks readily on exterior exposure and protective coatings will eventually flake and may delaminate. For exterior durability, users should consider Polyaspartic Coatings (refer to CCS Technical for product information).

Before applying PU coatings ensure that CCS Duratrac HB Epoxy is thoroughly dry (i.e. overnight) before application as they can reactivate the epoxy surface causing migration and yellowing of uncured epoxy hardener.

LIMITATIONS

Discolours and may chalk after prolonged exposure to UV sunlight – suitable for INTERIOR USE ONLY

Not recommended for use below 10°C or above 35°C (Minimum cure temperature 10°C)

Ensure surface to be coated is dry – moisture can cause blooming, discolouration and delamination

Avoid cold and/or damp. Application should be at temperatures a minimum 5°C above the dew point.

STORAGE

Store product between 10°C and 30°C away from direct sunlight. Partly used containers must be sealed tightly when not in use.

USER RESPONSIBILITY-PRODUCT SELECTION AND COMPATIBILITY

CCS warrant that their manufactured product is free from defects as well as being suitable for the purpose for which it is intended as long as it has been used and applied in accordance with the most current Technical Data Sheet from CCS.

In practice, differences in materials, substrates and actual site conditions require an assessment of product suitability for the intended purpose.

The user is responsible for checking the suitability of products for their intended purpose.

Further, combinations of products that form a total system are often required to service particular applications. Due to the multitude of products available to service an application, only products from the CCS system of products must be used in combination with this product to ensure it will be suitable for the purpose for which it is intended.

The product must also not be mixed or used in combination with any other product which is not a product supplied by CCS

For further information consult the Safety Data Sheet and read the product label carefully before use.

Safety Data Sheets are available from

www.concretecoloursystems.com.au or by calling 1800 077 744.

Please note: The information given in this data sheet is based on our current knowledge of the product when properly stored, handled and applied. We cannot guarantee that the product will be suitable, effective or safe when used for any purpose other than its stated uses. To the extent that it is lawful, we exclude warranties implied by law and limit our liability to the cost of replacing the product. We accept no responsibility for loss or injury causes by improper use, incompetent preparation, inexpert or negligent application, or ordinary wear and tear. Service or advice given by our staff should not amount to responsibility for the project - since the owner or their contractor (and no River Sands), is responsible for the procedures relating to the application of the product.
